Web Development

- I. Controllers
- These are the controllers that we have. One of the controller is the **AuthController**. The **AuthController** in Laravel handles user authentication and registration functionalities. It includes methods for displaying login ('login') and registration ('register') pages, processing login submissions ('loginPost'), and handling user registration ('registerPost'). In 'loginPost', user credentials are validated, and if authentication succeeds, the user is redirected based on their role ('admin' or regular user). Failed login attempts return an error message. In 'registerPost', user input is validated, a new user is created with a hashed password, and upon successful registration, the user is redirected to the login page with a success message. This controller ensures secure authentication and user management while maintaining clear redirection logic for different roles.

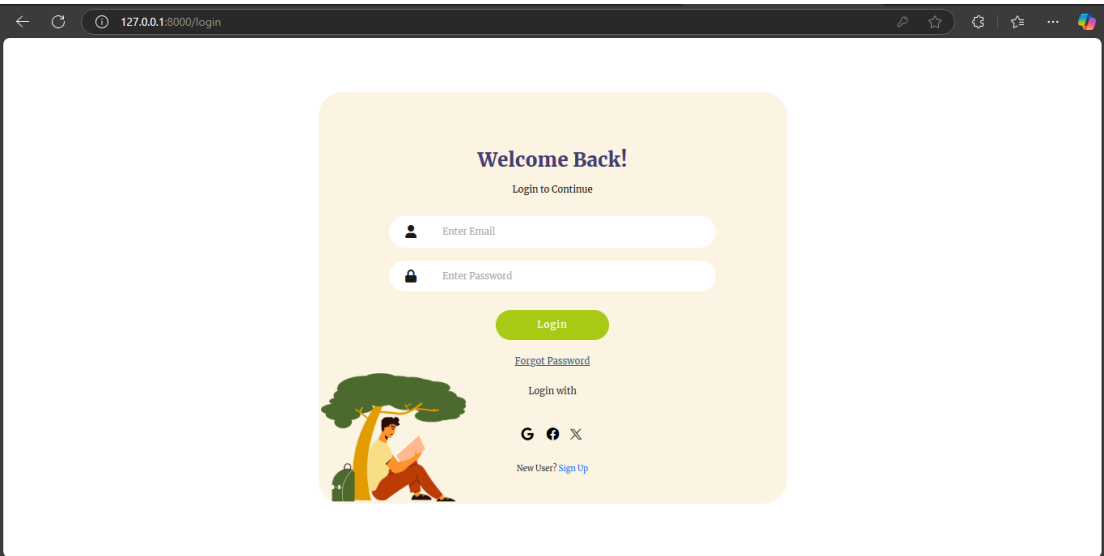

- II. Register controllers in routes to link methods to URLs.

```
routes/web.php
1 <?php
2
3 use App\Http\Controllers\AdminController;
4 use App\Http\Controllers\BooksController;
5 use App\Http\Middleware\logOutOnLandingPage;
6 use Illuminate\Support\Facades\Route;
7 use App\Http\Controllers\HomeController;
8 use App\Http\Controllers\AuthController;
9 use App\Http\Controllers\LandingPageController;
10 use App\Http\Controllers\ReviewController;
11 use App\Http\Controllers\ProfileController;
12
13 Route::get('/', [LandingPageController::class, 'index'])->name('landing-page');
14
15 Route::middleware(['auth', 'admin'])->group(function () {
16     Route::get('/admin-books-dashboard', [AdminController::class, 'showBooksDashboard'])->name('admin.books.dashboard');
17
18     Route::get('/admin/users/delete/{id}', [AdminController::class, 'deleteUser'])->name('admin.users.delete');
19     Route::delete('/admin/users/delete/{id}', [AdminController::class, 'deleteUser'])->name('admin.users.delete');
20
21     Route::post('/admin/review/{userID}/violation', [AdminController::class, 'incrementViolation'])->name('admin.review.violation');
22
23     Route::get('/admin/users/search', [AdminController::class, 'adminUserSearch'])->name('admin.users.search');
24     Route::get('/admin/reviews/search', [AdminController::class, 'adminReviewSearch'])->name('admin.reviews.search');
25     Route::post('/admin/reviews/delete', [AdminController::class, 'adminDeleteReviews'])->name('admin.reviews.delete');
26
27     Route::get('/admin/admin-users-dashboard', [AdminController::class, 'showUsersDashboard'])->name('admin.users.dashboard');
28     Route::get('/admin/admin-reviews-dashboard', [AdminController::class, 'showReviewsDashboard'])->name('admin.reviews.dashboard');
29
30     // Route for searching by title
31     Route::get('/admin/books/search', [AdminController::class, 'adminBookSearch'])->name('admin.books.search');
32 }
```

- III. Login Blade Php File

```
login.blade.php
1 <html lang="en">
2
3 <body>
4     <div class="dashboard_container">
5         <div class="row">
6             <p class="login>Welcome Back!</p>
7             <p class="sign">Login to Continue</p>
8
9             @if(session()->has("success"))
10                 <div class="alert alert-success">
11                     {{ session()->get("success") }}
12                 </div>
13             @endif
14
15             @if(session()->has("error"))
16                 <div class="alert alert-danger">
17                     {{ session()->get("error") }}
18                 </div>
19             @endif
20
21             <form class="login_form" method="POST" action="{{route('login.post')}}">
22                 @csrf
23                 <div class="input_container">
24                     <i class="fas fa-user icon"></i>
25                     <input type="text" name="email" placeholder="Enter Email" class="input_field" required>
26                     @if($errors->has('email'))
27                         <span class="text-danger">{{ $errors->first('email') }}</span>
28                     @endif
29                 </div>
30
31                 <div class="input_container">
32                     <i class="fas fa-lock icon"></i>
33                     <input type="password" name="password" placeholder="Enter Password" class="input_field" required>
34                     @if($errors->has('password'))
35                         <span class="text-danger">{{ $errors->first('password') }}</span>
36                     @endif
37                 </div>
38
39                 <button type="submit" class="btn btn-primary">Login</button>
40
41                 <a href="#" class="text-decoration: none; color: #007bff; font-size: 0.9em;">Forgot Password</a>

IV. Models

- The Book model in Laravel represents the books table in the database and manages its interactions. It uses the HasFactory trait to simplify model factory creation for testing or seeding. The model explicitly sets bookID as its primary key and enables timestamps for tracking creation and update times. The \$fillable array specifies the fields (title, author, genre, description, cover) that can be mass-assigned to prevent mass assignment vulnerabilities. Additionally, it defines two relationships: a one-to-many relationship with the Review model (reviews()), indicating that one book can have many reviews, and a many-to-many relationship with the User model (usersWhoFavorited()), representing users who have favorited the book through a pivot table named favorites. These relationships allow easy data retrieval and management between books, reviews, and user favorites.

- V. The Book model represents the books table in the database and facilitates interactions with book-related data. It uses the HasFactory trait, allowing the creation of model factories for testing and seeding purposes. The primary key is explicitly set to bookID, and timestamps are enabled to automatically track created_at and updated_at. The \$fillable property specifies the mass-assignable fields (title, author, genre, description, and cover) to ensure secure data handling. The model defines two key relationships: a one-to-many relationship with the Review model via reviews(), indicating that a book can have multiple reviews linked through the bookID foreign key, and a many-to-many relationship with the User model via usersWhoFavorited(), which maps users who have favorited a book using a pivot table named favorites. These relationships simplify accessing associated data like reviews and user favorites while maintaining database integrity and efficient querying.
